由于 NoStandbyLifCifsNdo_Alert，运行状况监视器引发"hm.alert.raised"

适用场景

- ONTAP 9
- CIFS

问题描述

- 事件日志显示：hm.alert.raised

  示例：

  Tue May 29 08:09:21 2018 [node-name: nchmd: **hm.alert.raised**:critical]: params: {'alert_id': **'NoStandbyLifCifsNdo_Alert'**, 'alerting_resource':

```
'svm-name', 'detailed_info': 'Alert Id = NoStandbyLifCifsNdo_Alert ,
Alerting Resource = svm-name', 'monitor': 'node-connect'}
```

- System health alert 显示:

  ```
  ::> system health alert show Node: node-name Resource: svm-name
  Severity: Minor Indication Time: Tue May 29 08:09:21 2018 Suppress:
  false Acknowledge: false Probable Cause: Vserver "svm-name" is
  actively serving data over CIFS through node "node-mame", and there
  are CIFS files opened persistently over continuously available shares.
   However, its partner node "other node-name" is not exposing any
  active data LIFs for the Vserver. Possible Effect: In the event that
  node "node-name" fails, node "other node-mame" will witness the
  condition very quickly. If a data LIF for Vserver "svm-name" existed
  on node "node-name", that node would have the capability to bring
  active connections away from node "other-node-name" non-disruptively
  and faster than waiting for the data LIF to fail over and the client
  to recover on its own. Corrective Actions: Create a data LIF on node
  "node-name" for Vserver "svm-name", or move an existing one to that
  node.
  ```
