## 报告了运行配置不正确的交换机的ClusterIfIslDownWarn

[https://kb-cn.netapp.com/on-prem/Switches/Cisco-KBs/ClusterIfIslDownWarn\\_reported\\_for\\_switch\\_with...](https://kb-cn.netapp.com/on-prem/Switches/Cisco-KBs/ClusterIfIslDownWarn_reported_for_switch_with...)

Updated: 周五, 11 7月 2025 12:59:41 GMT

### 适用场景

- Cisco Nexus 集群交换机
- ONTAP 9

### 问题描述

- 在应用新RCf后、集群报告ClusterIfIslDownWarn。

Node: NetappNode1

Alert ID: ClusterIfIslDownWarn\_Alert

Resource: Ethernet1/32

Severity: Major

Indication Time: Thu Mar 07 08:48:42 2024

Suppress: false

Acknowledge: false

Probable Cause: The cable used to connect switch

"Cluster-sw02(FDXXXXXXY)/Ethernet1/32" to the  
ISL port might be faulty. For the port-channel, please  
check each individual link.

Possible Effect: Cluster redundancy might be lost.

Corrective Actions: 1) Check whether the cable is fully inserted into the  
interface port on both ends.

2) Reconnect the ISL port using another cable. After  
reconnecting it, verify whether the link of the ISL  
port is up by executing the commands per the switch  
configuration guide or by checking whether the Link  
status LED is on.

- 在实际RCF文件和交换机的show running-config 命令输出中观察到的差异。
